1 P R O C E E D I N G S

2 1:00 p.m.

3 MR. MICHAEL HALPERN: Good morning -- or
4 good afternoon. My name is Michael Halpern. And
5 I am deputy director of the Center for Science and
6 Democracy at the Union of Concerned Scientists.
7 Welcome to this virtual public hearing hosted by
8 the Union of Concerned Scientists on the
9 Environmental Protection Agency's proposed
10 supplemental rule titled *Strengthening*
11 *Transparency in Regulatory Science*. This session
12 is being recorded and should post to the UCS
13 YouTube page shortly after this session ends.

14 We appreciate you taking the time to
15 provide public comment on the proposed
16 supplemental rule. Nearly one hundred people have
17 registered to provide public comment today. We
18 are going to begin hearing public comments
19 shortly. And we do have some space at the end of
20 this session. So, if you would like to register
21 to speak at the end of the session, please email
22 ucsvph@gmail.com. That's ucsvph@gmail.com.

1 First, I am going to turn this over to
2 Ken Kimmell, President of the Union of Concerned
3 Scientists. Ken, please go ahead.

4 KEN KIMMELL: Hi. Good afternoon to some
5 and good morning to others. Let me just check,
6 can everyone see and hear me?

7 MICHAEL HALPERN: Yes.

8 JASON JACOBSON: Yes, we can.

9 KEN KIMMELL: Great. Well, I am going to
10 start by saying that we actually shouldn't be here
11 today. The Union of Concerned Scientists is
12 hosting this public hearing because the
13 Environmental Protection Agency has refused to do
14 so.

15 It is highly unusual for a non-
16 governmental organization like us to hold public
17 hearings on a significant public policy proposal
18 that's being advanced by a federal agency.
19 Typically, of course, when a federal agency puts a
20 rule out for public comment, it is their
21 responsibility to hold a public hearing,
22 particularly while the public comment period is

1 open.

2 Interest in this particular proposal is
3 very, very high. The initial draft of the
4 proposal went out for public comment and there
5 were roughly six hundred thousand public comments
6 that were entered into the record in a three-and-
7 a-half-month time frame.

8 Now this supplemental rule that we are
9 here today to talk about significantly changes the
10 initial proposal, but the opportunity for public
11 input on these changes is currently severely
12 limited. Especially when one considers the
13 sweeping nature of this proposal and the many ways
14 that the EPA has made changes to the proposal
15 since the original draft.

16 For purposes of this proposal, the EPA
17 originally provided a thirty-day window for public
18 comments with no public hearing. They recently
19 extended the public comment window to sixty days
20 with a deadline of May 18th, but with no public
21 hearings. In our view, this is grossly
22 insufficient.

1 During normal times, the government
2 recommends a minimum sixty-day comment period for
3 the simplest of proposals. But these are not
4 normal times and this is not a simple proposal.

5 Numerous science and public health
6 organizations, including UCS, urge the EPA to
7 extend the public comment period by at least sixty
8 days, preferably thirty days beyond the end of the
9 declared national public health emergency.

10 We also asked for virtual public
11 hearings. The agency has unfortunately refused
12 both of those requests. We went an extra mile and
13 invited EPA to send staff to listen in on today's
14 hearing and ask questions of those providing
15 comment. The EPA also declined that invitation
16 unfortunately.

17 Now the COVID crisis poses profound
18 challenges to our country and to our world. The
19 virus has disrupted all of our lives. Many of us
20 are working remotely while caring for children who
21 are out of school. Others are taking on this
22 crisis directly and working extra hours at great

1 risk. From healthcare workers to sanitation
2 workers, the public health organizations are
3 working overtime to provide scientific advice to
4 protect individuals and communities throughout the
5 country.

6 Some people even have reduced access to
7 technology. So, all of these conditions make it
8 extremely difficult for public comment.

9 And therefore, it is enormously
10 impressive to me that more than a hundred people
11 have registered to speak today. This is a
12 testament to just how many people realize the
13 significance of this proposal as to EPA's ability
14 to meet its mission to protect public health and
15 the environment.

16 We heard, by the way, from many more who
17 don't have the bandwidth to provide comprehensive
18 feedback on the proposal due to other commitments
19 created by the pandemic.

20 Today's public hearing of course is not
21 the only opportunity that you will have to provide
22 public comment. I encourage everyone to develop

1 written comments to respond directly to the
2 proposal. And UCS has developed a guide to
3 providing effective public comments on this rule
4 on its website.

5 So, let me leave you with a framing
6 question. I know that all of us can and must
7 agree, especially in the light of the crisis we
8 are in now, that the best science, the best data,
9 and the best analysis is not only important, it's
10 not only essential, it is literally a matter of
11 life and death.

12 So, the question for today is, is the
13 EPA's proposal on the table likely to advance that
14 imperative of having the best science available or
15 will it undermine this imperative? And I think
16 that is the key question to focus on.

17 So, I am going to turn it back to
18 Michael. We expect the EPA to do its job and seek
19 feedback on its proposals. But when the agency
20 fails, as is the case today, it's our job to step
21 in and make sure that the agency receives as much
22 feedback as possible.

1 So, I look forward to the comments today.
2 And I want to thank all of the people who have
3 signed up to take part of this important endeavor.
4 And with that, I would like to turn it back to
5 you, Michael.

6 MICHAEL HALPERN: Thank you, Ken.

7 So, I would like to provide a little bit
8 of background information and briefly describe the
9 proposed rule on which we are taking comments
10 today.

11 So, the EPA described the rule as
12 follows: *The Supplemental Notice of Proposed*
13 *Rulemaking proposes that the scope of the*
14 *rulemaking apply to influential scientific*
15 *information as well as significant regulatory*
16 *decisions.*

17 *The notice proposes definitions and*
18 *clarifies that the proposed rulemaking applies to*
19 *data and models underlying both pivotal science*
20 *and pivotal regulatory science. In the SNPRM, EPA*
21 *is also proposing that a modified approach to the*
22 *public availability provisions for data and models*

1 *that would underly significant regulatory*
2 *decisions and an alternate approach.*

3 *Finally, EPA is taking comment on whether*
4 *to use its housekeeping authority independently or*
5 *in conjunction with appropriate environmental*
6 *statutory provisions as authority for taking this*
7 *action.*

8 Now for both oral and written comments,
9 EPA will only consider feedback that directly
10 addresses the supplemental proposal. Therefore,
11 please do your best to speak to the changes in the
12 rule that are made in the supplemental proposal.

13 Today's hearing will work as follows.
14 Members of the public preregistered to speak and
15 were assigned a speaking time, they were asked to
16 sign-in to the webinar at least twenty minutes
17 before their scheduled time in case we run ahead
18 of schedule.

19 We are here today to hear your comments
20 on EPA's proposed supplemental rule. We will not
21 respond to questions from attendees or speakers.
22 In order to accommodate all speakers, testimony is

1 limited to four minutes. After your name is
2 called, we will ask you to proceed with your
3 testimony.

4 The transcript from this public hearing
5 will be submitted to the docket and a recording
6 will be made publicly available. If you have any
7 written comments or other documents that you would
8 like to submit for the record, please email them
9 to the email you received your confirmation from,
10 which is ucsvph@gmail.com.

11 That same email, if you are watching the
12 broadcast, you can also register to speak by
13 emailing ucsvph@gmail.com and you will be added to
14 the queue if time permits.

15 We will make our best efforts to ensure
16 that any comments spoken in languages other than
17 English will be translated into English in the
18 written transcript.

19 If you have any additional comments after
20 today, please follow the instructions in the
21 Federal Register notice for this proposal, and
22 submit them by May 18th, 2020. And again, UCS has

1 provided a guide for people who want to make
2 effective comments on its website.

3 Today's hearing is broken into three
4 separate sessions, the first of which began this
5 morning at 9:00 a.m. This session at 1:00 p.m.
6 And one later today at 5:00 p.m. Eastern Daylight
7 Time.

8 Each session is being streamed live
9 through the Union of Concerned Scientists YouTube
10 channel and can also be viewed on the UCS website.

11 And finally, we ask for patience during
12 this virtual hearing, because we know that people
13 have varying internet bandwidths and familiarity
14 with this kind of technology. And if someone has
15 technical difficulties when it is their turn, we
16 will move on to the next speaker and return to the
17 person who had technical difficulties later in the
18 session. And people can always submit their
19 testimony as prepared for delivery if they decide
20 or if they have trouble overall.

21 All right. So, let's get started. I am
22 going to turn it over to Jason Jacobson, who is

1 going to be running today's hearing. Jason,
2 please take it away.

3 JASON JACOBSON: Thank you, Michael. As
4 a reminder, all attendees are muted automatically.
5 We will unmute you when it is your turn to speak.
6 If you wish to turn on your video, you may do so.

7 We will now begin with our public
8 comments. The first speaker will be William
9 Reilly, followed by Nsedu Witherspoon. And after
10 that we have Surili Patel.

11 William, you may begin.

12 WILLIAM REILLY: Thank you. It's
13 extraordinarily constructive of the Union of
14 Concerned Scientists to take on the responsibility
15 of doing what EPA has chose not to do in this
16 instance, which is to have this public hearing.
17 Let me just say that looking back to the
18 beginnings of EPA, the administrator, then
19 Ruckelshaus, said that he felt constrained by the
20 insufficiency of scientific and health information
21 which he needed to set early standards and
22 criteria. Since that time, EPA has given the

1 highest priority to ensuring the integrity of the
2 science on which its regulatory decisions are
3 made.

4 Enormous consequences flow from those
5 decisions. Non-attainment of cities which have
6 significant economic reverberations. The
7 confidence of the public in the protection of
8 their health, the trust to comply with difficult
9 and sometimes costly regulations.

10 In 1989 the science advisory board at my
11 request analyzed the policies of the agency. And
12 the question was to what degree do they respond to
13 the priorities that you see affecting the health
14 and the ecology of the United States. They set
15 out the criteria with a great deal of supporting
16 data and analysis. And I used, and other
17 administrators have used the science from them,
18 from the National Academy of Sciences, from the
19 National Institute of Health, through long-
20 standing protocols which affect the quality and
21 preparation of scientific opinion. Those are
22 being called into question by EPA at this time.

1 It is enormously consequential that we reconsider
2 elements of this proposal.

3 Other countries watch very closely of
4 what we do. I can recall the Chinese chose to
5 abandon their plan to build ten million
6 refrigerators containing chlorofluorocarbons ozone
7 depleters as a consequence of EPA research. The
8 decision made in 1992 to declare side stream smoke
9 a class A carcinogen was immediately accepted by
10 the American public as a substantial decision
11 based upon health criteria that deserved to be
12 respected. And within two years, four hundred
13 cities had changed their rules on side stream
14 smoke and smoking indoors. What EPA does depends
15 on the confidence of the public. It depends on
16 the integrity of the science basis for its
17 decision making. Both have been put into question
18 by the current proposed regulation.

19 JASON JACOBSON: Thank you, William.
20 Next, we have Nsedu Witherspoon, followed by
21 Surili Patel. And after that will be Laura
22 Bender.

1 NSEDU WITHERSPOON: Thank you so much to
2 UCS for this opportunity. For over twenty-eight
3 years, the Children's Environmental Health Network
4 has been a national voice committed to protecting
5 all children from the harmful effects of
6 environmental hazards and to promoting a healthier
7 environment. As the executive director, and on
8 behalf of CEHN, I appreciate the opportunity to
9 provide these comments on EPA's proposed
10 supplemental rule strengthening transparency in
11 regulatory science.

12 CEHN is strongly opposed to the proposed
13 supplemental rule and believes it is even more
14 harmful to children's health and safety than the
15 previous version in many ways. The original
16 proposal rule sets transparency standards that are
17 too rigid and impossible to meet. It required
18 that all data used in rulemaking be publicly
19 available and allows EPA to exclude data that
20 relies on confidential patient information.

21 Critical studies which have led to
22 significant advancements in protective policies,

1 for example, from the EPA NIEHS's Children's
2 Environmental Health and Disease Prevention
3 Research Centers may certainly be excluded. This
4 supplemental rule expands which studies can
5 protect -- can be excluded even further. It now
6 applies to an influential science at the agency --
7 to all influential science, not just the science
8 used in regulatory efforts. The original
9 exclusion applied only to those dose response
10 research evaluating at what level a toxic chemical
11 is toxic.

12 Further critical studies on health
13 impacts which use medical information would also
14 be excluded. The supplemental rule requires a
15 lengthy and cumbersome reanalysis of already
16 rigorously reviewed and analyzed raw data to make
17 sure there are no errors in data calculations.
18 This is a lengthy and unnecessary requirement,
19 especially since scientific studies and data
20 analysis undergo rigorous peer review and standard
21 quality assurances and control. And EPA already
22 has a review process in place. All of this

1 additional data analysis and number crunching is a
2 waste of time and will result in delays to public
3 health protections, not to mention the cost of the
4 reanalysis to the agency and to researchers.

5 The new standard would also put greater
6 weight on studies that make their raw data
7 publicly available. This criterion is arbitrary
8 and does not judge a study by standard scientific
9 evaluation, such as the strength of its design or
10 methods which are current acceptable metrics used
11 to evaluate the merit of a scientific study.

12 Lastly, EPA has made no attempt to
13 address the six hundred thousand comments received
14 on the original proposed rule. And in doing so,
15 has essentially ignored the scientific community,
16 as well as leading public health organizations
17 regarding valid concerns to the public's health
18 and safety, given these comments were never
19 addressed, the concerns, including those submitted
20 by CHEN regarding children's health stand,
21 including two very important comments.

22 The proposed rule would restrict EPA's

1 ability to set regulations informed by
2 confidential data that cannot be replicated. This
3 is of serious concern because from many older,
4 longstanding landmark studies the original
5 datasets were either not maintained or stored in
6 outdated formats. And these could be eliminated
7 under the proposed rule.

8 The proposed rule could also block the
9 use of longstanding landmark studies on the
10 harmful impacts of the toxic exposures and
11 pollution, studies which were instrumental in the
12 creation of the Clean Air Act, the Safe Drinking
13 Water Act, the Food Quality Protection Act, and
14 others.

15 Now more than ever CEHN is concerned with
16 the supplemental rule that will adversely affect
17 EPA's ability to use the best available science in
18 decision making and negatively influence existing
19 and future protections for children's health, such
20 as clean air, clean water, and prevention of toxic
21 exposures.

22 CEHN is also concerned about many aspects

1 of the supplemental rule that are cumbersome,
2 unnecessary, and costly. As we did with the first
3 proposed rule, CEHN requests that you withdraw the
4 proposed supplemental rule strengthening
5 transparency and regulatory science. Restricting
6 EPA's ability to consider best available research
7 will severely damage the integrity of evidence-
8 based rulemaking. EPA will be unable to fulfil
9 its mission to safeguard human health, especially
10 the health of children and that of future
11 generations. Thank you.

12 JASON JACOBSON: Thank you, Nsedu. Next
13 up we have Surili Patel, followed by Laura Bender.
14 And after Laura is Liz Hitchcock.

15 Surili, please go ahead.

16 SURILI PATEL: Thank you for the
17 opportunity to speak on behalf of the American
18 Public Health Association on the serious public
19 health implications of the strengthening
20 transparency in regulatory science supplemental
21 rule. My name is Surili Patel.

22 APHA is a diverse community of public

1 health professionals that champions the health of
2 all people in all communities. Together we speak
3 out for science by bringing all disciplines of
4 public health together so that we can work on
5 cross cutting issues. And we publish a peer-
6 reviewed research journal, the American Journal of
7 Public Health, which is regarded as one of the
8 leading scientific public health journals around.

9 We also speak out for action, to provide
10 a collective voice to advocate at the federal
11 level for laws and regulations that will advance
12 the public's health and sound science. And we
13 speak out for health because we believe in health
14 equity and access to care for everyone in every
15 community.

16 As APHA's director for the Center for
17 Climate Health and Equity, I work to inspire action
18 and advance policy that addresses climate change
19 at the nexus of health equity. And as the deputy
20 director for the Center for Public Health Policy I
21 advise the organization's environmental health
22 program.

1 So today I speak on behalf of the
2 association and our members, the reliable public
3 health professionals that protect communities
4 across the country when I say we uphold the
5 transparency of science and support access to
6 data. The scientific process is built on
7 validation and peer review. The strengthening
8 transparency and regulatory science supplementary
9 rule would greatly limit the research used to
10 inform national action to protect the environment
11 and the public health effectively. And the
12 scientific process has checks and balances to
13 minimize methodological biases against certain
14 populations. So, picking and choosing to admit
15 certain studies would limit a comprehensive
16 picture of the problem and possibly the solution
17 thus perpetuating health and equity.

18 EPA should use the best available
19 research to set limits on air pollution, exposure
20 to toxic substances, and establish public health
21 protections for other environmental threats.
22 There are many instances where exposure of raw

1 data to the general public would mean reviewing
2 patient information, which should remain
3 confidential as an ethical measure to conduct
4 research. However, excluding this research would
5 substantially weaken the science needed to support
6 environmental public health regulation.

7 By including influential scientific
8 information within the scope of the rule, EPA
9 restricts its ability to use the best science
10 available in decision making. It also works
11 towards biasing the scientific process and
12 stacking the deck against vulnerable populations,
13 like low-income communities and communities of
14 color.

15 Some communities are exposed to both
16 intrinsic factors like life stage, genetics, and
17 underlying diseases, as well as extrinsic factors
18 like social and life circumstances, such as
19 poverty, that determine a biological response to
20 chemical exposure. To protect communities faced
21 with co-exposures, EPA must establish science to
22 adequately identify and assess susceptible and

1 highly exposed groups.

2 Therefore, we join other leading public
3 and environmental health organizations to urge EPA
4 to withdraw the rule in a time where science and
5 evidence-based strategies are the only way to
6 protect communities across the country. Thank
7 you.

8 JASON JACOBSON: Thank you. Next up we
9 have Laura Bender, followed by Liz Hitchcock. And
10 after Liz is Gretchen Goldman.

11 Laura, please go ahead.

12 LAURA BENDER: Good afternoon. Thank you
13 so much to the Union of Concerned Scientists for
14 holding today's virtual public hearing. My name
15 is Laura Kate Bender. And I am the national
16 assistant vice president for Healthy Air at the
17 American Lung Association. The lung association's
18 mission is to save lives by improving lung health
19 and preventing lung disease.

20 We strongly oppose EPA's so-called
21 strengthening transparency in regulatory science
22 supplemental proposal. So, you have heard from

1 many representatives of the public health and
2 medical community, including some of my
3 colleagues, about the ways this proposal would
4 undermine human health. I would like to take a
5 few minutes to highlight the lack of transparency
6 in EPA's work on this rule that got us to this
7 point.

8 This is a sweeping proposal that would
9 impact a wide range of public health safeguards,
10 essentially affecting every future decision at
11 EPA. And yet EPA's process in issuing it has been
12 haphazard, rushed, and anything but transparent.

13 When the original version of this
14 proposal came out in 2018, then Administrator
15 Scott Pruitt prematurely announced it while it was
16 still undergoing agency review and inter-agency
17 review at the White House office of management and
18 budget. Then when the media inquired about the
19 discrepancy, OMB actually backdated the clearance
20 by several days. If that date is accurate, it
21 means that OMB only originally reviewed the
22 proposal for forty-eight hours.

1 This rule was also originally proposed
2 without a regulatory impact analysis. The EPA
3 then originally failed to consult the agency's own
4 science advisory board about the proposal. The
5 SAB has since released a draft report finding
6 significant deficiencies with the proposal and
7 held public hearings.

8 We strongly urge EPA to wait until SAB
9 has finished considering the rule and then take
10 the recommendations from the board into account
11 before moving to finalize it.

12 The supplemental rule is a significant
13 revision and expansion of the original proposal
14 and it merits an official EPA hearing of its own.

15 We appreciated the opportunity to
16 participate in EPA's public hearing on the
17 original proposal. We also appreciated that EPA
18 extended the public comment on this version of the
19 proposal from thirty to sixty days. However, that
20 extension and the lack of official public hearing
21 do not allow for adequate review of the rule,
22 especially by the public health and medical

1 community.

2 Pulmonary and critical care physicians,
3 nurses, and respiratory therapists and others who
4 are on the front line of COVID 19 response, many
5 researchers who study lung disease are very
6 interested in the proposed rule are focused on
7 testing and treating patients to prevent further
8 spread extending the comment period further can
9 push back the deadline to a time when these
10 experts will have more opportunity to prepare
11 meaningful comments.

12 My experience at the American Lung
13 Association has been with the public health
14 scientific and medical experts who I work with are
15 more interested in offering input of this proposal
16 than most other EPA actions that it ever worked
17 on. Before the pandemic, when the supplemental
18 proposal was under review at OMB, we organized a
19 meeting with them by phone all together nine
20 researchers and medical professionals from across
21 the country. These lung health experts shared
22 with OMB the many ways that the existing

1 scientific process is sufficient for ensuring
2 transparency while protecting study participants
3 privacy. They also shared the potential
4 implications for patients if future air pollution
5 standards are not based on the available health
6 science.

7 Now, however, the health and medical
8 professionals that volunteer their time for the
9 lung association are stretched thin. This
10 proposed rule has major implications for their
11 work, but many are responding to the COVID 19
12 pandemic and simply need more time to weigh in
13 meaningfully.

14 The lung association fundamentally
15 disagrees with EPA's premise in both the original
16 and supplemental proposal. The science that the
17 agency uses to inform its decision making is
18 already transparent. This rule is a solution in
19 search of a problem.

20 However, even if EPA moves forward, we
21 urge the agency to take the final SAB
22 recommendations in account first, as well as to

1 allow additional time for public comment, taking
2 into account the COVID 19 pandemic. Thank you.

3 JASON JACOBSON: Thank you, Laura. Next,
4 we have Liz Hitchcock, who will be followed by
5 Gretchen Goldman. And after Gretchen, we have Liz
6 Borkowski.

7 Liz, you may go ahead.

8 LIZ HITCHCOCK: Thank you. My name is
9 Liz Hitchcock. And I direct Safer Chemicals
10 Healthy Families, a national campaign to protect
11 Americans from toxic chemicals. We lead a
12 coalition of local, state, and national
13 organizations that came together out of our
14 concern -- our common concern about toxic
15 chemicals in our homes, places of work, and
16 products that we use every day. This public
17 hearing is magnifying the voices of the American
18 public, a public that has had its health harmed
19 again and again by our exposures to toxic
20 chemicals.

21 We applaud UCS for stepping up and doing
22 the job that the Environmental Protection Agency

1 should have done. And we are ecstatic that there
2 are so many participants that I have got a strict
3 four minutes limit, so I can't really spend enough
4 time thanking UCS.

5 EPA's proposed supplemental rule is
6 flawed and ill conceived. In the name of
7 transparency, it will burden EPA scientists with
8 unnecessary and costly processes that run counter
9 to the agency's long-standing obligation to base
10 public health decisions on the best available
11 science. The damage that the rule will inflict on
12 equality and timeliness of the EPA's science is
13 not justified by any benefit of the proposed rule.

14 While its supporters have painted a bleak
15 picture of EPA reliance on so-called secret
16 science developed behind so-called closed doors
17 based on data that has been withheld from the
18 American people, is that really the problem or is
19 this an effort to solve an imaginary problem,
20 something that they call so-called secret science,
21 something that in order to -- saying that in order
22 to strengthen transparency, the EPA should only

1 use research if the public can see every last
2 piece of underlying raw data.

3 If enacted, the censorship of the so-
4 called secret science rule would allow EPA to
5 ignore thousands of rigorous peer-reviewed health
6 studies, making it harder for EPA staff to protect
7 us from toxic chemicals and easier for the Trump
8 administration to rollback regulations.

9 EPA scientists working on health -- risk
10 and health hazard assessments collect and review
11 thousands of studies. Published reports of these
12 studies typically don't include all of the
13 underlying data. Under this proposal, EPA would
14 need to contact the researcher, ascertain the
15 nature and extent of underlying data, and put in
16 place a mechanism for the public to access the
17 data.

18 Analyzing the house legislation -- house
19 legislation that would impose similar obligations
20 on EPA, the Congressional budget office and the
21 EPA staff concluded that the cost of
22 implementation would be at least two hundred and

1 fifty million dollars a year. Moreover, rather
2 than devoting the time and effort to assure access
3 to underlying data, EPA staff may follow the path
4 of least resistance and simply drop many studies
5 from consideration, shrinking the body of
6 scientific evidence on which decisions are based.

7 EPA science assessments generally include
8 an exhaustive and critical review of relevant
9 studies and a full explanation of how they are
10 being interpreted. Extensive information about
11 each study is typically part of the public record
12 even if all underlying data may not be included.
13 EPA assessments are normally subject to public
14 comment and independent peer review. And members
15 of the regulatory community are free at any time
16 to replicate studies they deem flawed, or to
17 independently seek access to underlying data and
18 reanalyze them.

19 In short, the so-called problem that the
20 proposed seeks to fix is largely imaginary. Let's
21 make no mistake. The stakes for EPA science and
22 the protection of public health are simply too

1 high to finalize this deeply problematic and
2 unnecessary proposal.

3 And as our lives are disrupted by the
4 COVID-19 pandemic and resources are appropriately
5 diverted to deal with the crisis, we should not be
6 distracted from the fact that the Trump EPA is not
7 skipping a beat on rolling back public health
8 protections.

9 Thank you for holding this public
10 hearing. And thank you for all of the work that
11 UCS does.

12 JASON JACOBSON: Thank you, Liz
13 Hitchcock. Next, we have Gretchen Goldman, who
14 will be followed by Liz Borkowski. And after Liz
15 Borkowski, we will have Liz Mueller.

16 Gretchen Goldman, go ahead. Gretchen, go
17 ahead.

18 GRETCHEN GOLDMAN: Great. Thanks. Thank
19 you for the opportunity to comment. I am the
20 research director at the Center for Science and
21 Democracy at the Union of Concerned Scientists.

22 Much has been said about the ways that

1 the EPA's April 2018 draft rule would undermine
2 the ability of the agency to carry out its
3 mission. Today I would like to focus on elements
4 of the supplemental notice that worsen the impact
5 of this rule.

6 First, the supplemental proposal expands
7 what was already a sweeping proposal. With
8 expanded definitions and more inclusive terms such
9 as applying the rule to all models and all
10 influential science, it is now crystal clear that
11 the policy stands to fundamentally alter how the
12 EPA can view science to protect public health and
13 the environment.

14 Second, the tiered access approach
15 proposed in the supplemental notice fails to
16 address the central underlying concern with this
17 rule, that it would require the disclosure of
18 confidential data in order for the EPA to use the
19 science. Even if a tiered access approach is
20 implemented, researchers cannot share personal
21 health data that they are legally and ethically
22 bound to protect. The supplemental notice fails

1 to address this fundamental threat to the agency's
2 ability to use the best available science.

3 Further, a tiered access system would be
4 costly and near impossible for the EPA to
5 implement with existing resources, let alone
6 individual researchers if the responsibility were
7 passed to them. The proposal provides no clarity
8 on who will be responsible for the launch and
9 maintenance of a tiered access system and how it
10 would be managed, an endeavor that would require
11 significant resources in order to mirror the CDC's
12 research data center, which the supplemental
13 notice cites as a model.

14 The alternative weighting approach
15 proposed would unfairly and arbitrarily devalue
16 legitimate scientific work that the EPA relies on.
17 At an agency charged with protecting public
18 health, studies involving health data are
19 especially crucial. Many of these crucial health
20 studies will be needlessly downgraded in EPA
21 decision under -- decision making under this
22 weighted approach.

1 Alarminglly, the supplemental notices
2 states that the goal is for stakeholders to
3 reanalyze the data and models that EPA uses. This
4 is a waste of time and resources for an agency
5 that already relies on extensive stakeholder and
6 public input on rules and transparent ways.
7 Hamstringing the agency's ability to use science
8 for the purpose of providing industry-tied
9 researchers the chance to unnecessarily reanalyze
10 scientific work tips the scales against the public
11 interest.

12 In the summer of 2018, I gave public
13 comment on the draft rule with my one-month old
14 infant in tow. I didn't have to be there, but I
15 chose to be. This is a rule that will affect the
16 ability of my children and all others in this
17 country to breathe clean air, drink clean water,
18 and enjoy a safe environment.

19 The EPA cannot do that under this
20 proposal. I urge the agency to abandon this ill-
21 advised and dangerous proposal. Thank you.

22 JASON JACOBSON: Thank you, Gretchen.

1 Next, we have Liz Borkowski, followed by Liz
2 Mueller. And then -- and then Leonard Buckle.

3 Liz Borkowski, please go ahead.

4 LIZ BORKOWSKI: Thank you. Thank you for
5 the opportunity to present comments. My name is
6 Liz Borkowski. And I am the managing director of
7 the Jacobs Institute of Women's Health at the
8 Milken Institute School of Public Health at the
9 George Washington University.

10 The Jacobs Institute is disturbed by
11 EPA's supplemental notice of proposed rulemaking
12 to strengthening transparency in regulatory
13 science because its proposed changes are
14 inadequate to address concerns about consideration
15 of studies that involve confidential data. EPA's
16 proposed changes fall far short of a system that
17 would be practicable, while engendering confidence
18 among both researchers and potential study
19 participants.

20 To address the fact that participants in
21 environmental health studies are typically assured
22 confidentiality and that this precludes making

1 data publicly available, EPA suggests that when
2 developing regulations or finalizing influential
3 scientific information, it gives greater
4 consideration to studies for which data have been
5 made available.

6 Using non-scientific criteria to evaluate
7 scientific studies is thoroughly inappropriate and
8 at odds with established practices for evaluating
9 study quality. For instance, the strengthening of
10 the reporting of observational studies in
11 epidemiology or STROBE checklist does not include
12 public availability of data.

13 The threat of ignoring or down-weighting
14 a study if its data are not available places
15 pressure on scientists to release data, they might
16 otherwise keep confidential. Given the rapidly
17 developing evidence base about the possibilities
18 of reidentifying anonymized data, scientists
19 conducting research today might understandably
20 prefer to err on the side of limiting data access.
21 The supplemental language regarding tiered access
22 by which authorized researchers can access

1 restricted data, and the public a less
2 identifiable form, is far too vague and limited to
3 engender confidence among researchers or those who
4 might participating in studies.

5 For instance, it does not define
6 authorized researchers or mention the
7 institutional review boards that govern human
8 subjects research in academia.

9 EPA's invocation of the National Center
10 for Health Statistics Research Data Center, or
11 RCD, acknowledges the necessity of establishing a
12 way to provide carefully controlled access to
13 identifiable data, but it fails to demonstrate
14 that it has fully considered how such a model
15 might be used for the many studies the agency
16 ought to be considering.

17 The supplemental language merely states
18 that the RDC is a model and that EPA is conducting
19 a pilot study on how RDC might host EPA datasets.
20 This falls far short of the kind of detail
21 necessary before finalizing a rule.

22 Because RDC contains data collected by

1 CDC and other federal agencies, not by independent
2 academic researchers, a great deal of additional
3 work and infrastructure would be necessary before
4 it could host the full range of data that should
5 be informing EPA work.

6 The fact that RDC charges researchers
7 three thousand dollars to access a single year's
8 data hints at the substantial cost associated with
9 the enterprise. EPA does not appear to have
10 calculated the cost that the agency and outside
11 researchers would incur in order to create a
12 system that evaluates researchers' proposals and
13 provides them with access to the appropriate level
14 of data.

15 It also has not explained who would be in
16 charge of making those determinations, a crucial
17 issue given that communities disproportionately
18 harmed by pollution might not trust EPA to make
19 them.

20 EPA's proposal forces an untenable choice
21 on researchers, know that their study will be
22 inappropriately down-weighted or accept the

1 problems that can accompany submission of their
2 research into a repository that has not been
3 satisfactorily described. When environmental
4 health researchers inform potential study
5 participants that their data will be placed into
6 such a repository, they will likely find it harder
7 to recruit. The problem will be particularly
8 acute in historically marginalized and
9 disproportionately polluted communities whose
10 involvement is essential.

11 If EPA moves forward with the rule it has
12 proposed it will undermine science in decision
13 making by making it difficult and potentially
14 impossible to conduct and consider the best
15 available science. This will have detrimental
16 impacts on reproductive justice, health equity,
17 and women's health.

18 The Jacobs Institute of Women's Health
19 urges EPA to withdraw this rule. Thank you to the
20 Union of Concerned Scientists for holding this
21 hearing.

22 JASON JACOBSON: Thank you, Liz

1 Borkowski. Next up we have Liz Miller -- excuse
2 me, Liz Mueller, followed by Leonard Buckle.

3 Liz, go ahead.

4 LIZ MUELLER: Thank you so much. Good
5 afternoon. My name is Liz Mueller. And I am the
6 National Director of Advocacy of the American Lung
7 Association Healthy Air Campaign.

8 Today you have heard from individuals in
9 the public health and medical community, including
10 some of my colleagues, about the dangers of the
11 strengthening transparency in regulatory science
12 proposal.

13 Today I would like to talk about the
14 processes already in place that review health
15 studies, highlighting how the science in
16 communities is already transparent.

17 The proposal excludes studies when
18 underlying data cannot be shared with the public.
19 It introduces alternative pathways that may be
20 deployed to allow consideration of some studies.
21 But make no mistake, case studies will not be
22 fully considered if EPA finalizes this rule.

1 While studies involving laboratory
2 animals might be able to meet this requirement,
3 many studies examining the effects of
4 environmental stressors on real people will not be
5 able to meet the demand of public data sharing.

6 Publicly sharing information about
7 diagnosis, hospitalizations or deaths, as well as
8 where a study participant lives, works, or goes to
9 school is not feasible because it would constitute
10 a major breach of privacy.

11 Before a health study of humans can even
12 begin, investigators must complete a rigorous
13 review by an institutional review board to ensure
14 that the risk to participants, including risk to
15 privacy, are minimized. As part of its review,
16 the institutional review board carefully
17 scrutinizes the consent form that study
18 participants will sign to ensure the form detailed
19 how a participant's private data might be shared
20 and what safeguards will remain in place to
21 protect their privacy after the study's
22 completion.

1 This proposed rule by EPA would prevent
2 most research about the health effects of
3 pollution in the real world from informing EPA
4 policy because the underlying data about the
5 participants of these health studies cannot be
6 shared with the public.

7 On the question of replication, there
8 already exists a mechanism within the scientific
9 community to validate studies. Major health
10 journals, including Lancet, the Journal of the
11 American Medical Association, and the New England
12 Journal of Medicine, and agencies like the EPA,
13 require researchers to specify a data sharing plan
14 as part of their research application.

15 The purpose of this sharing from
16 scientist to scientist is to facilitate the
17 replication of findings or to pool together data
18 from multiple studies. There are strict
19 requirements outlined in a signed agreement among
20 those involved that the receiving scientist must
21 demonstrate that she or he had the skills,
22 resources, and safeguards to appropriately use and

1 protect the data. If there are questions,
2 entities like the Health Effects Institute, or
3 HEI, have conducted review.

4 For example, in July of 2000 the Health
5 Effects Institute conducted a reanalysis of the
6 two early air pollution studies, the Harvard Six
7 City Study and the American Cancer Society's study
8 on a link between particulate matter pollution and
9 mortality. The reanalysis was conducted by a team
10 of independent scientists, was overseen by a
11 diverse ward of stakeholders, and affirmed the
12 findings of the original studies.

13 Publishing a scientific health study is a
14 year's long process that involves intense scrutiny
15 from others in the scientific community. To say
16 that published studies that have gone through this
17 process are not reviewed and validated is absurd.
18 The science that the agency has used for years is
19 already transparent and rigorously reviewed.

20 The EPA is trying to fix a problem that
21 does not exist. Thank you so much for your time
22 and for your attention today.

1 JASON JACOBSON: Thank you, Liz. Next,
2 we have Leonard Buckle.

3 Leonard, go ahead.

4 LEONARD BUCKLE: Thank you very much for
5 giving me the opportunity to make my comments
6 about the EPA changes to its standards.

7 My background is forty years of doing
8 research in methodological approaches to the study
9 of interdisciplinary problems. My professional
10 perspective is that of a philosopher of the -- of
11 a pragmatic persuasion.

12 The science approach -- the approach to
13 science that the EPA chooses to use to make
14 distinctions between those science -- pieces of
15 science will be regarded as acceptable and those
16 that are not is something left over from
17 preexisting Liechtenstein European philosophy.

18 It is a purely -- it is a purely
19 objectivist point of view. And it is totally out
20 of line with American thinking for the last
21 century-and-a-half. The dichotomy draws flaws and
22 invidious comparisons between most acceptable

1 pieces of social research, medical research, and
2 biological research, and those pieces of research
3 that would be appropriate for laboratory science
4 of the physical, chemical, or possibly biological
5 persuasion.

6 This dichotomy further is the wrong set
7 of dichotomies is the wrong dichotomy to draw for
8 the Environmental Protection Agency. Their choice
9 of replicability private/public data and
10 reproducibility is actually accomplishable only by
11 a small fraction of all science. And the traction
12 tends to lie outside the area of the EPA's
13 involvement.

14 We are privilege -- in bench laboratory
15 work and sacrifice of more -- more substantial and
16 relevant material concerning environmental
17 protection, public health, and general public
18 safety.

19 The second -- the third major problem is
20 that this research is at entirely at odds with the
21 ethics and practical limitations set forth by
22 other agencies as my previous colleagues have

1 discussed. This research is impossible --
2 research that would fit these standards is
3 impossible under the guidelines of any IRB in any
4 institution doing business with the United States
5 government. This leaves the research available
6 virtually nonexistent.

7 In effect, the EPA is defining away its
8 very base. This opens the gateway to me for a
9 concern for what alternatives the EPA chooses to
10 imagine for its basis with making decisions. In
11 particular, I am concerned in the extreme that
12 instead of using scientifically based facts they
13 are going to be building models built on
14 speculation and public and private opinion.

15 My concern is raised -- is raised because
16 for several years I have been involved in research
17 into the operations research. And my concern is
18 that one can build into the models one produces
19 the assumptions one wishes to achieve, to set
20 to accomplish the outcome one wishes to have.

21 In other words, the only proof of those
22 models' success is that it ran, and that does not

1 prove that it has any correlation at all with
2 reality. I fear the EPA is going to employ this
3 as its major vehicle for decision making and
4 alternative - as an alternative to science. Thank
5 you.

6 JASON JACOBSON: Thank you, Leonard.
7 Next up we have R. Stephen Berry.

8 R. STEPHEN BERRY: Yes. I have very
9 little to contribute except one thing that I am
10 I have become very embarrassed about the whole way
11 that this administration has dealt with the --
12 with the EPA, with the environment, with all of
13 the issues that we are discussing today.

14 And it seems to me that this
15 administration has simply changed the name of the
16 EPA. It's no longer the Environmental Protection
17 Agency, it's become the Environmental Pollution
18 Agency. And that's my contribution, I'm afraid,
19 my bitterness.

20 JASON JACOBSON: Thank you, R. Stephen
21 Berry. Right now, we have a few attendees who
22 haven't been able to join us electronically so we

1 will be taking a short break. We want to make
2 sure that we stay consistent with the schedule and
3 people's scheduled speaking times. So, we will
4 take a short break until 2:10 p.m., at which point
5 we will hear from Mark Peters. Thank you very
6 much.

7 (Whereupon, a recess was taken.)

8 JASON JACOBSON: Hello, everyone.
9 Welcome back. We will now hear from Mark Peters.

10 Mark, are you ready?

11 MARK PETERS: I am. Thank you very much.
12 I appreciate your labor on all our behalf by the
13 way. I have a degree -- are we ready to go?

14 JASON JACOBSON: Go ahead.

15 MARK PETERS: Thank you. I have a degree
16 in philosophy and a degree in medicine. And have
17 been a physician assistant for over forty years,
18 primarily doing cardiothoracic and vascular
19 surgery. And have been a researcher and managed
20 datasets and data collection for national studies.

21 At any rate, when asked to explain the
22 difference between a doctor and a P.A. I have

1 answered by explaining that if you want to know
2 why something works, ask a doctor. If you want to
3 know how something works, as a P.A.

4 Along those lines, I would like to talk
5 about the work of scientists and statisticians.
6 And rather than talking about confounding
7 variables, randomization and matching observers or
8 subjective bias, and on and on, not to mention at
9 all the willingness of study participants to share
10 personal data, like cholesterol levels or body
11 mass index, I'd like to tell a little story. That
12 story is of a small town where the town selectmen
13 have been asked to try and consider some actions
14 to increase the number of ministers in the town.

15 At the next town meeting, the selectmen
16 bring the matter up. And someone notes the towns
17 with more telephone poles have more ministers.
18 That said, a motion is passed to add more
19 telephone poles to the town. Of course, it is at
20 great cost with -- from our outside view having a
21 predictable result of knowing the increase in
22 number of ministers.

1 Of course, this might be a hopefully
2 humorous, but yet insightful story to consider the
3 fact that science should be left to the scientists
4 and data should be left to the statisticians. And
5 as it has been pointed out by many other
6 attendees, that the processes in place -- and in
7 my own personal experience, scientists love
8 nothing more than to prove each other wrong, do a
9 great deal of review and study of data and the
10 analytic processes to analyze that data to say
11 here is where it should be done differently. And
12 then that is done and the results of studies are
13 confirmed or not. And that's just a superficial
14 understanding of how the science works.

15 The other issue in my career, having done
16 cardiothoracic and vascular surgery, I spent a
17 great portion a great percentage of my time
18 treating people with the diseases of tobacco use.
19 And we know the end result of a long history of
20 malfeasance by the tobacco industry to suppress,
21 deny, obfuscate, and actually lie about the data
22 that was privy only to them in the early years of

1 the twentieth century.

2 Historically back in the 1600's, in fact,
3 an anonymous paper was published in London about
4 chimney sweeps who were smokers, suggesting some
5 correlation between lung disease and occupational
6 and personal choice hazards.

7 At any rate, the legal status and the end
8 result of that malfeasance is just an example of
9 how industry might influence data even at the
10 government level through lobbyists, as we know
11 from that case. And so, there is great risk
12 involved. Currently, as of 2018, the data
13 suggests that four hundred and eighty thousand
14 people a year have been dying from tobacco use.
15 And that is even with all of the data available to
16 show that it is potentially lethal.

17 So, in order to avoid those kinds of
18 situations, we need to ask that this change in
19 regulation not be implemented. Thanks.

20 JASON JACOBSON: Thank you, Mark. Next,
21 we will take another short break. And we will
22 come back at 2:25 to hear from Barry Gupman.

1 (Whereupon, a recess was taken.)

2 JASON JACOBSON: Thank you for joining us
3 at the virtual public hearing for the supplemental
4 rule on EPA proposal strengthening transparency
5 and regulatory science.

6 Next up we'll be hearing from Barry
7 Goppman, followed by Janet Ward.

8 Barry, you may begin your public
9 comments. Barry?

10 BARRY GOPPMAN: Hi, my name is Barry
11 Goppman. And I want to start out by saying I have
12 no scientific background, but I do have a human
13 functionality background, which has given me the
14 belief to author this critical opinion of the EPA.
15 So, I believe the EPA should change its -- change
16 its name to the ENPA, Environmental Non-Protection
17 Agency.

18 Twenty plus years ago I moved myself and
19 my family to Smyrna, Georgia. It had all of the
20 attributes I was looking for, but it also had a
21 dirty little secret, EtO emissions. And my house
22 was only three miles from the source of the

1 emissions, Sterigenics. Up until 2016, EtO was
2 classified as a potential human carcinogen. In
3 2016, it was reclassified as a known human
4 carcinogen. No warnings either written or posted
5 existed to warn citizens then, as now.

6 Citizens and the politicians were
7 completely in the dark. The new 2016 EtO
8 classification was actually covered up by the EPA,
9 Karen Hays, who is the director of toxicity here
10 in Georgia, who never even sent out a press
11 release, saying the public wouldn't understand.

12 Sterigenics has been operating emitting
13 very high over the legal limit levels of EtO for
14 forty years. It was allowed to hide in plain
15 sight and operate on a storage facility operating
16 permit, not a hazardous duty permit facility
17 permit it should have been.

18 Who was the EPA protecting here,
19 residents or big business? My lifestyle has
20 always been one of health and fitness, including
21 many Ironman triathlons and marathons.

22 Three years ago, I was diagnosed with an

1 incurable form of leukemia, which all but took my
2 fitness lifestyle away. I spent more than
3 fourteen thousand hours working out on the Silver
4 Comet trail, which is a fitness trail located less
5 than two miles from Sterigenics over the last
6 twenty years.

7 I believe this long-term exposure to the
8 unknown carcinogenic EtO gas at an increased lung
9 level usage caused and/or directly contributed to
10 my cancer. Others with the same lifestyle as I in
11 other parts of the country report similar
12 occurrences. The cancer has caused me side
13 effects, including severe anemia, which sometimes
14 leaves me breathless from just getting out of my
15 car. It has also caused other types of cancers
16 and neurological problems in many others who lived
17 in close proximity of Sterigenics EtO plant
18 exposure.

19 The EPA and the Georgia EPD have shielded
20 this company from reprimand, including helping
21 them craft a behind closed doors work order to
22 upgrade and change their plant's emission system

1 without public knowledge or view. This breaks the
2 law that they wrote. When the legality of this
3 agreement was challenged, Sterigenics was banned
4 from the building until a correct operating permit
5 was replaced. Then the EPA looked the other way
6 when they blatantly ignored that order and did the
7 work anyway while they were still under the
8 confines of this order.

9 Sterigenics has operated without
10 consistent and reportable EPA supervision for
11 forty years. And has multiple problems, including
12 explosions and unreported leaks.

13 Are they above the law? The EPA and the
14 FDA show an over-reliance on EtO and are listening
15 to lobbyists to get information rather than doing
16 true scientific inquiry about the problem. This
17 creates a dramatic lap of two data points around
18 EtO pollution.

19 I believe this shows chemical history
20 capture of our regulatory agencies. Using data
21 modeling based on industry's self-reported
22 information subverts the ability of citizens

1 living near these EtO based facilities to know the
2 full truth about the levels of poisoning that have
3 occurred.

4 Lobbying efforts have created an
5 environment at all levels of government that tips
6 the scales steeply towards the industry and away
7 from the health of our communities. They are
8 protecting no one, just enabling criminal
9 companies that are way more interested in profits
10 over people to continue on that path.

11 The Environmental Non-Protection Agency
12 is the correct name for the EPA. Thank you.

13 JASON JACOBSON: Thank you, Barry
14 Goppman. Next, we will hear from Janet -- Janet
15 Ward.

16 JANET WARD: Thank you. My name is Janet
17 Ward. I am a resident of New Hampshire and a
18 member of the board of a New England-wide
19 environmental organization.

20 The Environmental Protection Agency was
21 founded in December 1970 under the Republican
22 administration of President Richard Nixon, who was

1 keenly aware of the environmental damage being
2 done in the United States.

3 This damage represented a clear and
4 present danger to public health. The EPA's
5 mission was and ought to continue to be the
6 protection of public health, and holding to
7 account polluters whose actions endanger public
8 health.

9 The proposed new rules on what studies
10 the agency can cite in making regulations would be
11 determined by a political appointee rather than by
12 qualified scientists. These proposed rules gut
13 the ability of the agency to oversee and establish
14 necessary regulations to protect public health and
15 safety.

16 The perpetrators of these new rules are
17 banking on the inability of the public to
18 understand and appreciate the danger these changes
19 represent.

20 I am a member of the voting public. I
21 understand the ramifications of these new rules.
22 And I intend to publicize their dangers as widely

1 as possible.

2 These rules are unnecessary, dangerous,
3 and crafted with political objectives in mind.
4 Their implementation would destroy the ability of
5 the EPA to do the work it was founded to do.

6 Thank you for the opportunity for sharing
7 these reflections.

8 JASON JACOBSON: Thank you, Janet Ward.
9 Next up we will hear from Andy Bessler.

10 Andy, go ahead.

11 ANDY BESSLER: Can you hear me okay?

12 JASON JACOBSON: We can hear you and it
13 looks like your video is obscured.

14 ANDY BESSLER: I'm not too sure -- oh,
15 sorry about that.

16 My name is Andy Bessler. I am the
17 project director for the National Tribal Air
18 Association. And NTAA was founded in 2002 under
19 the Bush administration for improving air quality
20 with the grant from the United States
21 Environmental Protection Agency, with the mission
22 to advance air quality management programs and

1 policies consistent with the needs, interests, and
2 legal status of American Indian Tribes and Alaskan
3 natives.

4 Tribes are important partners with
5 federal, state, local agencies to protect ambient
6 air quality, indoor air quality, and mitigate
7 climate change. The National Tribal Air
8 Association maintains a membership of one hundred
9 and fifty-one member tribes around the country.
10 And we are submitting comments on this proposal.
11 And we have recently held an informational webinar
12 for tribes around the country on this proposal
13 last week. And that is all posted on our website,
14 which is ntaatribalair.org.

15 The National Tribal Association has
16 several comments regarding this proposal from EPA,
17 this supplemental proposal on transparency in
18 science.

19 For one, the comment period is inadequate
20 -- is inadequate. Tribes are very much focused on
21 protecting public health and maintaining a strong
22 economy during this pandemic.

1 NTAA is opposed to the proposed expanded
2 scope of this proposal. We oppose the EPA's
3 administrator's exemption discretion. We oppose
4 the lack of authority for the proposal and its
5 failure to consider tribes and environmental
6 justice communities.

7 The agency decision making must be based
8 on best available science. Some environmental
9 statutes explicitly say this, others it is
10 implied, and others appear to be based on court
11 decisions.

12 This proposal will cause valid and
13 relevant science to be excluded or given less
14 weight, which is out of bounds with EPA's mission
15 to protect public health.

16 The proposal to address public health
17 information is vague and doesn't concern
18 feasibility or cost. Expanding -- expanding the
19 applicability makes these problems worse and it
20 doesn't fix any of the existing issues.

21 A big opposition that NTAA has is regards
22 to the EPA's administrator's discretion. The

1 proposed exemption that the administrator can
2 grant could put the trust in the administrator
3 without mandatory standards. It could be used
4 positively to exempt public health studies, or it
5 could be used negatively exempting industry
6 chemical regulation studies, for example.

7 Suggestive mandatory exemptions are there
8 for certain studies or they suggest mandatory
9 exemptions for certain studies, but all of this
10 depends on the political (inaudible) on EPA
11 administrator rather than really following what
12 the science dictates.

13 We have opposition to the proposed
14 expanded scope. The proposal expands
15 applicability for significant regulatory actions
16 and discusses other terms, like influential
17 scientific information and dose response models.
18 So, these are terms that are not really -- they
19 are expanding applicability beyond what currently
20 exists.

21 There is a proposal for tiered access
22 based on other federal agency programs. And the

1 proposal applies regardless of when the study was
2 performed. So, there is expanded scope that we
3 oppose.

4 Also, there is a lack of authority. The
5 proposal has changed the authority EPA seems to
6 rely on. And it's solely on housekeeping
7 authority statute for executive departments, in
8 combination with corrective environmental statutes
9 listed in the original proposal.

10 This really is a backward rulemaking
11 proposing an action and then asking for help to
12 determine authority. It is cited authority that
13 doesn't authorize the rule. And it's -- in an
14 event of a conflict, the proposal says that other
15 statute or regulations may apply.

16 Finally, there is a failure to consider
17 responsibility to Tribes and to environmental
18 justice communities. There was no analysis
19 performed of tribal implications or environmental
20 justice implications.

21 EPA actions, whether they are significant
22 regulatory actions or influential scientific

1 information, will impact tribal communities. And
2 EPA must hear and address tribal concerns with
3 this proposal.

4 Finally, EPA already has a strong system
5 for using science in the rulemaking process.
6 There is integrated science assessments, risk and
7 exposure assessments, all involved in the policy
8 making process. And if it's not broke, then don't
9 fix it. So, we oppose this proposal and thank you
10 for your time.

11 JASON JACOBSON: Thank you for your
12 comments. At this point in the program we will be
13 taking a short break so that we can stay
14 consistent with our schedule.

15 Please come back and we will be checking
16 in every ten minutes. Thank you.

17 (Whereupon, a recess was taken.)

18 JASON JACOBSON: Thank you for joining
19 the virtual public hearing on the supplemental
20 rule on EPA proposal strengthening transparency
21 and regulatory science hosted by the Union of
22 Concerned Scientists.

1 Next up we will hear from Claire

2 Richards. Claire?

3 CLAIRE RICHARDS: Can you hear me okay?

4 JASON JACOBSON: Claire, we can hear you.

5 You can begin.

6 CLAIRE RICHARDS: Hi. Thank you for
7 having me. As a nurse scientist, my oath is to do
8 no harm and to protect the health and safety of my
9 patients. I am angry that the EPA is trying to
10 further restrict the type of research that can be
11 used in public health protection decisions and
12 scientific assessments.

13 While as a nurse, I really need to be
14 addressing the public safety concerns that are due
15 to the Trump administration's fangled response to
16 COVID-19 -- in particular, I have been trying to
17 focus on how we can continue to provide high
18 quality care in the context of a pandemic with a
19 shortage of personal protective equipment,
20 especially for the most vulnerable in long-term
21 settings. So, I am pretty angry right now that I
22 am unable to focus on this and that our government

1 is working to push through rules to benefit
2 industries while I need to be working to protect
3 patients and families right now.

4 I oppose the EPA's rule that states that
5 all research used to support agency rules would be
6 covered by these transparency requirements, not
7 just dose response studies. This means that most
8 research focused on the impact of contaminants on
9 human health could not be used because they rely
10 on information protected by HIPAA. This is
11 atrocious and makes absolutely no sense. The
12 HIPAA privacy rule governs public health
13 information, which is individually identifiable
14 information about an individual's care, health
15 condition, or payment for care. I think
16 transparency can be encouraged by making code
17 available and can improve the quality of science,
18 but not necessarily by requiring scientists to
19 make underlying data available when there is more
20 than minimal risk of being able to identify an
21 individual.

22 I would like to refer the EPA to a paper

1 published called Big Data and Public Health
2 Navigating Privacy Laws to Maximize Potential that
3 was published by Thorpe and Gray in 2015. There
4 are ways to modify the rules so that only
5 identifiers, including city, state, and zip code
6 are included in publicly available datasets.

7 Furthermore, a typical review of studies
8 included in high impact journals rely on peer
9 review rather than publicly available datasets,
10 where the methods and summaries of dataset results
11 and inferences, and limitations of studies are
12 evaluated.

13 I think it should be noted that the lack
14 of clarity as to how researchers can make their
15 data available or how much it would cost creates a
16 tremendous burden on researchers and should be
17 addressed by the EPA.

18 Furthermore, the fact that the EPA
19 administrator has the authority to waive the
20 requirements for the data to be public on a case
21 by case basis is a clear conflict of interest
22 because the administrator is a political

1 appointee. And there is precedent for our
2 government to favor industry and short-term
3 economic rewards over human health.

4 So, thank you for having me. I clearly
5 oppose this rule.

6 JASON JACOBSON: Thank you, Claire. We
7 will resume a short break and have check ins every
8 five minutes. Thank you.

9 (Whereupon, a recess was taken.)

10 JASON JACOBSON: Good afternoon. You
11 have been listening to public comments provided by
12 the UCS hosted virtual public hearing regarding
13 the supplemental rule on the EPA proposal
14 strengthening transparency in regulatory science.
15 Thank you for joining us this afternoon. This
16 does conclude the afternoon session. The
17 recording of this session should be available on
18 the YouTube page of the Union of Concerned
19 Scientists shortly. The evening session will
20 begin at 5:00 p.m. and run for approximately one-
21 and-a-half hours. Thank you.

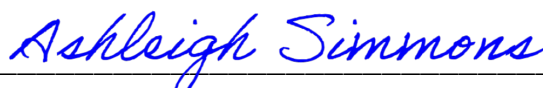

22 (Whereupon, the session was concluded.)

C E R T I F I C A T E

I, Ashleigh Simmons, Reporter, do hereby certify that I was authorized to and did report the Virtual Public hearing for the Union of Concerned Scientists; and that the transcript is a true and correct transcription of the testimony given by the participants.

I further certify that I am not a relative, employee, attorney or counsel of any of the parties, nor am I a relative or employee of any of the parties' attorneys or counsel connected with the action, nor am I financially interested in the action.

Dated this 28th day of April, 2020.

Ashleigh Simmons
Professional Reporter

The foregoing certification of this transcript does not apply to any reproduction of the same by any means unless under the direct control and/or direction of the certifying reporter.
